Installation for cloud vision API.
- Python: Install packages, `pip install virtualenv` and `pip install google-cloud-vision`, `pip install python-oauth2`, `pip install webcolors`, `pip install psycopg2` (or `pip install psycopg2-binary`). And any other missing packages that give errors, use pip install and the name for the others. Not that the python file we use was written for python 3.7. Python 2 will not work.
  - [More info](#) on cloud vision. I didn't follow the instructions provided but if the above doesn't work try what they say.

Usage For Everyone:
- Use .json file in the google doc file as the credentials for the application, look at code implementation.
  - VERY IMPORTANT: Do not push this JSON fill to the repository or put publically online.
- For Postgres refer to the javascript file or the python for username and password.
